

P1601 / P1702 set

RF Field Emission up to 1 GHz

Short description

The RF field emission probe set consists of a magnetic field probe and an E field probe. They are used to measure respective near fields, which are coupled out by an IC in operation/ a running IC. The measured data help to assess the separate emission of an IC according to the types of field.

Measurements and all calculations are carried out with the software ChipScan-ESA.
